

ABSTRACT

Conventionally, in a mobile terminal device, a plurality of images are successively switched so as to realize a moving picture. For this, it is necessary to accumulate a plurality of images in the mobile terminal device. There is provided a mobile terminal device for processing icon image information corresponding an icon whose selection has been detected and continuously displaying the icon image according to the new icon image information. Here, the icon image which has been processed after the display end is erased and not held in the mobile terminal device. Accordingly, a small memory of the mobile terminal device is not used by them. Moreover, the icon whose selection is detected may be processed only partially. Furthermore, among the icon image information corresponding to the icon detected, information indicating the color of the icon or information indicating the luminance may be entirely or partially changed so as to realize the variety of display.
